UnidifFuser 能够通过设置适当的时间步长生成各种类型的数据,例如图像、文本、文本到图像、图像到文本和图像-文本对。

UnidifFuser 在FID和CLIP分数的定量结果中不仅优于现有的通用模型,而且在文本到图像生成等代表性任务中还可以与Stable Difsion和DALL•E 2等定制模型相媲美

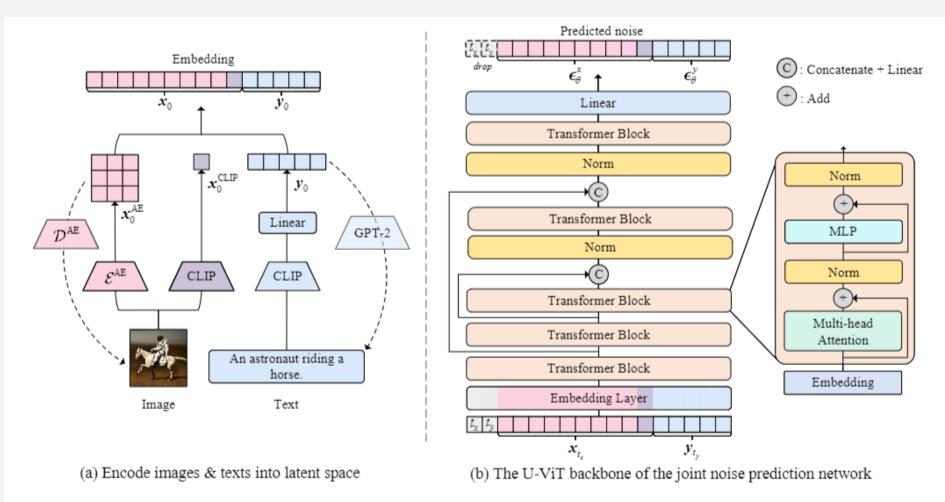

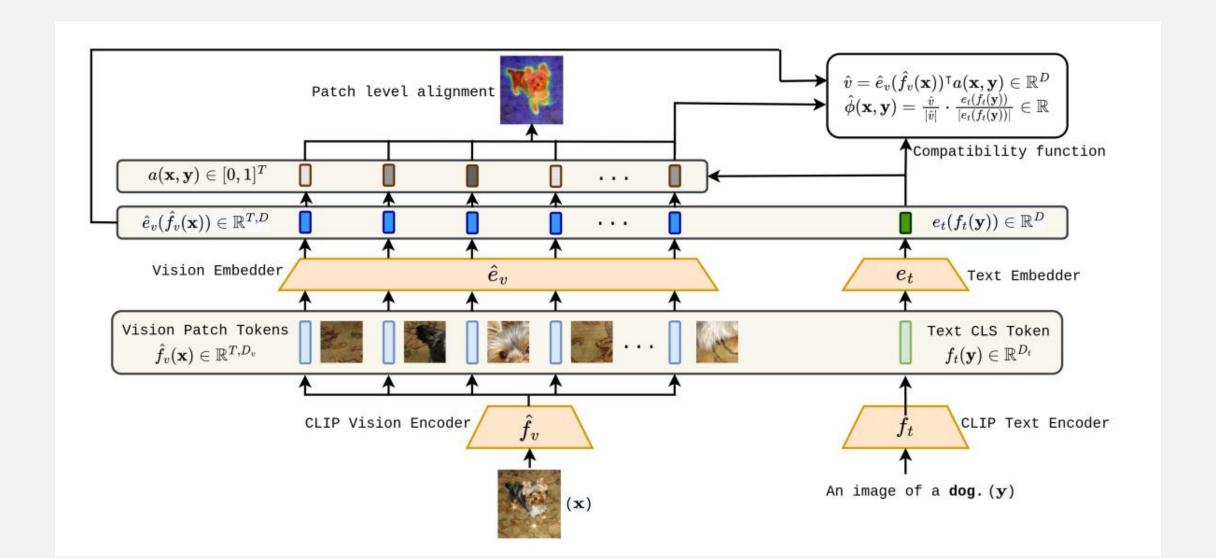

Figure 4. Implementation of UniDiffuser on image-text data. (a) First, we encode images and texts into latent space. (b) Second, we train UniDiffuser parameterized by a transformer (Bao et al., 2022a) in the way illustrated in Figure 2 on the latent embeddings.
